Comment:

The above output suggests the following interpretations for each of the variables. * People who have higher BMR are more likely to obese * Lower EIBMR1(Energy intake) increases obese probability (since the coefficient -0.434 is negative). * Lower ADTOTSE(Total mins spent sitting or lying down) increases obese probability (since the coefficient -4.590553e-05 is negative).

- Sex = 1 for males. So females are more likely to obese
- People on a diet are more likely to obese compared with people not on a diet
- People who have high fat and high protein diet type are more likely to obese
- People who have high carbon diet type decrease the probability of obesity

CV error

Comment:

The full model has the coefficients for BMR, EIBMR1, ADTOTSE, SEX, BDYMSQ04, CHOPER1 as statistically significantly different from zero at the 0.05 level. The fitted model is

 $\log it(p) = -0.1093 + 0.001879 \cdot \text{BMR} - 3.423 \cdot \text{SEX} - 0.7113 \cdot \text{EIBMR} \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.3802 \cdot \text{BDYMSQ04} - 0.01014 \cdot \text{CHOMERAL SECONDARY } \\ 1 - 0.00005952 \cdot \text{ADTOTSE} + 0.0000592 \cdot \text{ADTOTSE} + 0.0000592 \cdot \text{ADTOTSE} + 0.00000592 \cdot \text{ADTOTSE} + 0.000$

where p is the probability of obesity.

The effect of the significant variables on surival are: * Larger BMR reduces the probability of obesity. * Males have reduced the probability of obesity compared to women.

CV error for glms.

[1] 0.1777834

Comment: The CV error for glm is 17.78 percent

summary

We now display the results nicely using the package huxtable.

Warning: package 'huxtable' was built under R version 3.4.4

Methods	Errors
LDA	18.2
rpart	17.6
$_{ m glm}$	17.8

The effect of different predictors on obesity are relatively consistent. In summary:
